

# BLOCKOUT LIGHT

## LIGHT RESISTANCE CHARACTERISTICS OF A BLOCKOUT SHUTTER

Blockout Roller Shutters provide a simple and effective solution for controlling outside light from entering your property. They cut direct light by up to 99% (depending on which shutter style you chose) so you can eliminate the effects of:

- Streetlights
- Headlights
- Sunlight
- Glare.

The shutter's setting is easily adjustable to allow from unrestricted light, to soft filtered light and almost complete darkness. This level of light adjustment allows you to control your environment more effectively, including:

- Protecting your valuable furnishings such as carpets and furniture from fading through the harmful effects of ultra violet rays.
- Creating a blackout effect for shift workers who need to sleep during the day.
- Artificially adjusting light levels in bedrooms so parents manage better with children's sleep routines during the day or at any time.

As Blockout Roller Shutters are fitted externally, they create an insulating air pocket between the shutter and the window. This helps to keep your property insulated from winter cold, summer heat plus they reduce the amount of outside noise entering the building.
